

PANDORA

PANDORA A WORLD OF MYSTERY AND DANGER.

Pandora can be located from Earth's southern hemisphere, it is located in the Alpha Centauri solar system 4.4 light years from Earth. Pandora's sun is called ACA. Pandora is one of many moons orbiting Polyphemus a gas giant planet the size of Saturn. Pandora's toxic atmosphere makes it uninhabitable by humans.

A wide variety of animals can be found on Pandora that are dangerous. Most animals are hexapods (six limbed). Predators are the packs of viper wolves, there is also a Thanator the most fierce predator.

- Tropical rainforests cover a large part of each continent.
- The Hallelujah mountains are floating and constantly moving, magnetic fields plus unobtainium (a rare mineral mined by humans) make the mountains float.

The Na'vi are a tribe, they stand 9-10 feet tall and use bow and arrows which have a type of poison on their arrows. The direhorse is a six leg behemoth that the Na'vi use for hunting and tracking they also use the banshees for hunting from the air.

Every living creature has bioluminescence qualities.

Scientists suggest a symbiotic relationship between all things Pandora (symbols are small luminescence woodsprites which are the tree of hope's seeds, the tree of hope is believed to be the heart of everything).
